(54) REFLECTOR

(57) Abstract:

PURPOSE: To obtain a reflecting body used in the reflector for the fluorescent lamp of a backlight part such as a liquid crystal display element by laminating a flexible substrate having a high reflection layer formed thereon to a support.

CONSTITUTION: In a reflection formed by forming a high reflecting layer containing silver to the single surface of a flexible substrate 4 substantially blocking ultraviolet rays and laminating the substrate to a support 8 through an adhesive layer 7 on the side of the high reflecting layer, a flat reflecting plate wherein the bonding strength of the adhesive strength is 100g/cm or more and the thickness thereof is 0.5-50μm is bent so that the reflecting layer is formed into a curved surface having a radius of curvature of 5mm or less. By this constitution, no wrinkles are generated on the surface of the

flexible substrate even when a radius of curvature is 5mm or less and bending characteristics are extremely excellent and the durability against light and heat is improved.
